e) Config map and use case.

→ (i) It is an object which contained file having plain text-

(ii) It is easily readable contained & user can read easily.

(iii) It is not private its a public.

(iv) ✓ config map created virtual memory insideof cluster.

(v) To run any app^n we required config file for particular app^n. Stored in virtual memory.

＊ Use case — changing database URL without restarting app.

• without config maps :-

① You need to update the code application code or deployment , yaml file

② Then restart app^n to apply the changes

- with (config map):-

(i) You need to stored your database URL into the config map.

(ii) Then changes data base URL update immidiey the config map.

(iii) Then application automatically picks a up the new URL without restarting.
